

The Ratings View

October 24, 2024

This report does not constitute a rating action.

Key Takeaways

- Data centers are a bright spot for real estate given soaring AI-related demand.
- Rates may be falling, but floating-rate debt is still a concern for weaker credits.
- Negative ESG-related rating actions outweighed positive by four to one in Q3.

Growth potential is significant for the data center sector, with booming demand stemming from AI and other cloud services. We expect this to support rent and overall top-line growth for U.S. data center operators. Projects are increasingly large and numerous, with significant investments and project management as key constraining factors. These include securing large industrial land plots in the right areas to accessing and securing significant power needs. This trend has not driven any material rating actions so far, but risk appetite could curb companies' overall credit profiles. We view development, operating, leasing and technology risks as manageable over the next several years, but as technology and tenants' needs evolve there is rollover risk to release at lease maturity or tenant in sourcing. Other considerations, such as environmental footprint and obsolescence, may also influence rents and values over time, but we generally see them as remote or manageable risks for the short to intermediate term.

[Data Centers: More Gas Will Be Needed To Feed U.S. Growth](#)

Policy rates are starting to fall, but floating-rate debt is still a cause for concern. The pace and timing of the rate-cutting cycle is still highly uncertain, and rates remain near decade-high levels. This is pressuring some issuers--particularly those with floating-rate debt. Additionally, issuance of floating-rate debt remains strong, and if the descent of interest rates disappoints, it could place increasing pressure on these issuers. Issuers with floating-rate instruments tend to be lower rated. Year to date, 62% of instruments associated with North American defaulters have been floating rate, with most of those defaults occurring via a distressed exchange. Just over three-quarters of current weakest links have at least one floating-rate instrument. Unhedged, lower-rated floating-rate borrowers remain particularly vulnerable to the timing and extent of future rate cuts.

[Credit Trends: Floating-Rate Debt Is Still A Cause For Concern Despite Rate Reductions](#)

Negative ESG-related ratings actions outweighed positive ones by four to one in the third quarter. In this period, there were 36 rating actions related to environmental, social, and governance (ESG) factors. Governance factors remained the primary driver, representing 89% of ESG-related rating actions. Risk management, culture, and oversight was also still the main underlying factor with 17 actions. U.S. public finance continued to be the sector with the most ESG-related rating actions, although decreasing to 21 from 24 in the second quarter for a year-to-date total of 66 (or 58% of ESG-related rating activity for all practices this year). S&P Global Ratings is currently reviewing information from issuers affected by hurricanes Helene and Milton, which hit the Southeastern U.S. in recent weeks, to assess any related rating impacts.

The Ratings View

[ESG In Credit Ratings Q3 2024: Negative Actions Outweigh Positive By Four To One](#)

S&P Global Ratings updated its metal price assumption for 2024-2027, taking into account its expectations for lower economic growth around the world and lower inflation, but with persistent cost pressures to produce industrial metals. Our assumptions for the next few years reflect generally supportive demand from construction and machinery investments, even as U.S. economic growth slows with interest rates returning to neutral levels. Furthermore, production costs for metals are intractably higher, so we expect higher trough prices in a downturn.

[S&P Global Ratings Metal Price Assumptions: Prices Hold Steady Despite Headwinds](#)

Corporate Japan is on firm footing, even if the global economy falters. S&P Global Ratings expects ongoing stable creditworthiness for the Japanese corporate sector over the next one to two years. It will be supported by a strong financial base, in our view. Further improvement in creditworthiness is likely to be limited. Many Japanese companies will increase growth investments and shareholder returns amid market expectations for higher profit and improved capital efficiency. Growth investments exceeding our expectations are a potential risk factor for creditworthiness. We see a significant slowdown in global growth—mainly in the U.S. and China—and heightened geopolitical tensions as potential key risk factors.

[Japan Corporate Credit Spotlight: Resilience Amid Adversity Abroad](#)

Emerging markets (EMs) would be more severely affected than advanced economies if the Middle East conflict escalates, due to energy's larger share in their consumption basket. Higher oil prices could also delay interest rate normalization in some EMs. Credit conditions for EMs issuers remain favorable if the U.S. soft landing holds, but uncertainty around U.S. election outcomes could cause tighter financing conditions and increase borrowing costs and inflationary pressures. China's stimulus measures, including monetary easing and property market support, aim to boost sentiment and growth. However, weak credit demand limits their impact, with growth prospects hinging on the extent of additional fiscal stimulus.

[Emerging Markets Monthly Highlights: Navigating Risks Amid Fed Easing](#)

We think China's property sales could stabilize toward the second half of 2025 as prices in higher-tier cities and overall sales volumes steady. This will depend on the government's continued support for funding conditions for developers and efforts to reduce inventories. Structural obstacles still hinder sales. We estimate national property sales will decline to about RMB8.5 trillion-RMB9 trillion in 2024 and further to RMB8 trillion-RMB8.5 trillion in 2025. We expect Chinese developers to face shrinking liquidity buffers and rising leverage as sales and margins continue to decline. To replenish liquidity, developers will need to ensure they have access to smooth financing channels.

[China Property Watch: Charting A Path To Stabilization](#)

China's auto sector will be a survival of the fittest over the next 12-24 months. Margin pressure remains high for auto makers because of a price war and rising sales of electric vehicles (EVs). We expect domestic light vehicle sales to grow by 0%-3% annually in 2025-2026, from 0%-2% in 2024. Domestic EV sales will likely rise 10%-20% a year over the period, from about 30% this year. Upside may emerge if the government steps up stimulus that boosts economic growth and consumer confidence. Key risks are demand weakness, intense competition, and the transition to EVs.
